FIELD OF THE INVENTION

The present invention relates to organic compounds useful for therapy and/or prophylaxis in a mammal, and in particular to compounds that are preferential agonists of the Cannabinoid Receptor 2.

BACKGROUND OF THE INVENTION

The cannabinoid receptors are a class of cell membrane receptors belonging to the G protein-coupled receptor superfamily. There are currently two known subtypes, termed Cannabinoid Receptor 1 (CB1) and Cannabinoid Receptor 2 (CB2). The CB1 receptor is mainly expressed in the central nervous (i.e. amygdala cerebellum, hippocampus) system and to a lesser amount in the periphery. CB2, which is encoded by the CNR2 gene, is mostly expressed peripherally, on cells of the immune system, such as macrophages and T-cells (Ashton, J. C. et al. *Curr Neuropsychopharmacol* 2007, 5(2), 73-80; Miller, A. M. et al. *Br J Pharmacol* 2008, 153(2), 299-308; Centonze, D., et al. *Curr Pharm Des* 2008, 14(23), 2370-42), and in the gastrointestinal system (Wright, K. L. et al. *Br J Pharmacol* 2008, 153(2), 263-70). The CB2 receptor is also widely distributed in the brain where it is found primarily on microglia and not neurons (Cabral, G. A. et al. *Br J Pharmacol* 2008, 153(2): 240-51).

The interest in CB2 receptor agonists has been steadily on the rise during the last decade (currently 30-40 patent applications/year) due to the fact that several of the early compounds have been shown to have beneficial effects in pre-clinical models for a number of human diseases including chronic pain (Beltramo, M. *Mini Rev Med Chem* 2009, 9(1), 11-25), atherosclerosis (Mach, F. et al. *J Neuroendocrinol* 2008, 20 Suppl 1, 53-7), regulation of bone mass (Bab, I. et al. *Br J Pharmacol* 2008, 153(2), 182-8), neuroinflammation (Cabral, G. A. et al. *J Leukoc Biol* 2005, 78(6), 1192-7), ischemia/reperfusion injury (Pacher, P. et al. *Br J Pharmacol* 2008, 153(2), 252-62), systemic fibrosis (Akhmetshina, A. et al. *Arthritis Rheum* 2009, 60(4), 1129-36; Garcia-Gonzalez, E. et al. *Rheumatology (Oxford)* 2009, 48(9), 1050-6), liver fibrosis (Julien, B. et al. *Gastroenterology* 2005, 128(3), 742-55; Munoz-Luque, J. et al. *J Pharmacol Exp Ther* 2008, 324(2), 475-83).

Ischemia/reperfusion (I/R) injury is the principal cause of tissue damage occurring in conditions such as stroke, myocardial infarction, cardiopulmonary bypass and other vascular surgeries, and organ transplantation, as well as a major mechanism of end-organ damage complicating the course of circulatory shock of various etiologies. All these conditions are characterized by a disruption of normal blood supply resulting in an insufficient tissue oxygenation. Re-oxygenation e.g., reperfusion is the ultimate treatment to restore normal tissue oxygenation. However the absence of oxygen and nutrients from blood creates a condition in which the restoration of circulation results in further tissue damage. The damage of reperfusion injury is due in part to the inflamma-

2

tory response of damaged tissues. White blood cells, carried to the area by the newly returning blood, release a host of inflammatory factors such as interleukins as well as free radicals in response to tissue damage. The restored blood flow reintroduces oxygen within cells that damages cellular proteins, DNA, and the plasma membrane.

Remote ischemic preconditioning (RIPC) represents a strategy for harnessing the body's endogenous protective capabilities against the injury incurred by ischemia and reperfusion. It describes the intriguing phenomenon in which transient non-lethal ischemia and reperfusion of one organ or tissue confers resistance to a subsequent episode of "lethal" ischemia reperfusion injury in a remote organ or tissue. The actual mechanism through which transient ischemia and reperfusion of an organ or tissue confers protection is currently unknown although several hypotheses have been proposed.

The humoral hypothesis proposes that the endogenous substance (such as adenosine, bradykinin, opioids, CGRP, endocannabinoids, Angiotensin I or some other as yet unidentified humoral factor) generated in the remote organ or tissue enters the blood stream and activates its respective receptor in the target tissue and thereby recruiting the various intracellular pathways of cardioprotection implicated in ischemic preconditioning.

Recent data indicates that endocannabinoids and their receptors, in particular CB2 might be involved in preconditioning and contribute to prevent reperfusion injury by down regulation of the inflammatory response (Pacher, P. et al. *Br J Pharmacol* 2008, 153(2), 252-62). Specifically, recent studies using CB2 tool agonists demonstrated the efficacy of this concept for reducing the I/R injury in the heart (Defer, N. et al. *Faseb J* 2009, 23(7), 2120-30), the brain (Zhang, M. et al. *J Cereb Blood Flow Metab* 2007, 27(7), 1387-96), the liver (Batkai, S. et al. *Faseb J* 2007, 21(8), 1788-800) and the kidney (Feizi, A. et al. *Exp Toxicol Pathol* 2008, 60(4-5), 405-10).

Moreover, over the last few years, a growing body of literature indicates that CB2 can also be of interest in sub-chronic and chronic setting. Specific upregulation of CB1 and CB2 has been shown to be associated in animal models of chronic diseases associated with fibrosis (Garcia-Gonzalez, E. et al. *Rheumatology (Oxford)* 2009, 48(9), 1050-6; Yang, Y. Y. et al. *Liver Int* 2009, 29(5), 678-85) with a relevant expression of CB2 in myofibroblasts, the cells responsible for fibrosis progression.

Activation of CB2 receptor by selective CB2 agonist has in fact been shown to exert anti-fibrotic effect in diffuse systemic sclerosis (Garcia-Gonzalez, E. et al. *Rheumatology (Oxford)* 2009, 48(9), 1050-6) and CB2 receptor has emerged as a critical target in experimental dermal fibrosis (Akhmetshina, A. et al. *Arthritis Rheum* 2009, 60(4), 1129-36) and in liver pathophysiology, including fibrogenesis associated with chronic liver diseases (Lotersztajn, S. et al. *Gastroenterol Clin Biol* 2007, 31(3), 255-8; Mallat, A. et al. *Expert Opin Ther Targets* 2007, 11(3), 403-9; Lotersztajn, S. et al. *Br J Pharmacol* 2008, 153(2), 286-9).

The preparation of compounds of formula (I) of the present invention may be carried out in sequential or convergent synthetic routes. Syntheses of the compounds of the invention are shown in the following schemes. The skills required for carrying out the reactions and purifications of the resulting products are known to those skilled in the art. The substituents and indices used in the following description of the processes have the significance given herein before unless indicated to the contrary. In more detail, the compounds of formula (I) can be manufactured by the methods given below, by the methods given in the examples or by analogous methods. Appropriate reaction conditions for the individual reaction steps are known to a person skilled in the art. Also, for reaction conditions described in literature affecting the described reactions see for example: *Comprehensive Organic Transformations: A Guide to Functional Group Preparations, 2nd Edition*, Richard C. Larock. John Wiley & Sons, New York, N.Y. 1999). We found it convenient to carry out the reactions in the presence or absence of a solvent. There is no particular restriction on the nature of the solvent to be employed, provided that it has no adverse effect on the reaction or the reagents involved and that it can dissolve the reagents, at least to some extent. The described reactions can take place over a wide range of temperatures, and the precise reaction temperature is not critical to the invention. It is convenient to carry out the described reactions in a temperature range between -78°C . to reflux. The time required for the reaction may also vary widely, depending on many factors, notably the reaction temperature and the nature of the reagents. However, a period of from 0.5 hours to several days will usually suffice to yield the described intermediates and compounds. The reaction sequence is not limited to the one displayed in the schemes, however, depending on the starting materials and their respective reactivity the sequence of reaction steps can be freely altered. Starting materials are either commercially available or can be prepared by methods analogous to the methods

23

given below, by methods described in references cited in the description or in the examples, or by methods known in the art.

A) Halides II are either commercially available or can be synthesized according to methods known in the art. These halides II are conveniently reacted with sodium azide in a suitable solvent such as acetonitrile, ethanol or DMF to afford azide derivatives III. Alternative preferred conditions involve the use of solvents like DMA, NMP or DMSO, even more preferred are NMP and DMSO. In polar aprotic solvents like NMP and DMSO, the alkylations can usually be conducted at lower temperature than for example in acetonitrile, often at room temperature to 40° C. (this is the case for example for BnCl, 1-chloro-2-(chloromethyl)benzene or PMB-Cl; this depends of course on the reactivity of the Halides II) and hence provide a better process safety window (caution organic azides are of course known to be potentially dangerous and process safety has always to be carefully assessed). The

24

addition of water can be beneficial as it increases the solubility of sodium azide and provided more robust kinetic profiles as it helps to dissolve hard clumps of NaN₃. It can also lead to a better filterability of the final azide reaction mixture.

5 Filtration of the reaction mixture might be required for example when the following cycloaddition is performed in a continuous mode in small channels reactors. The azide is not isolated and its solution is best introduced in the next step. This also avoids its isolation which can also lead to safety issues.

b) Triazole derivatives IV can be prepared by a [3+2]cycloaddition of azide derivatives III with 2-cyanoacetamide in the presence of an appropriate base such as sodium methoxide or sodium ethoxide in a suitable solvent such as methanol, ethanol or DMF. Alternative preferred conditions involve reacting the azide with 2-cyanoacetamide in solvents like NMP or DMSO, in the presence of sodium hydroxide. The batch process is usually performed at room temperature to 50° C., preferably between room temperature and 40° C. (caution, process safety has always to be carefully assessed). The cycloaddition process is also amenable to continuous mode (for a relevant literature example, see *Org. Process Res. Dev.*, 2009, 13 (6), pp 1401-1406) and in this case the reaction temperature can be increased above 50° C., for example (but not limited to) between 50° C. and 90° C., preferably between 60° C. and 70° C.

c) Triazole derivatives V can be obtained by acylation of IV with an acyl-halide in the presence of a base such as DIEA, DMAP, pyridine and the like. Double acylation and the formation of nitrile side products have been observed. These can be significant when working for example in pyridine as solvent. However, these can be minimized when using DMA or NMP, preferably DMA as solvent instead of pyridine. Preferred conditions involve the use of 1.0-2 equiv. of pyridine and pivaloyl chloride, preferably 1.0 to 1.5 equiv, preferably around 1.5 equiv at 50-100° C., preferably between 75-85° C. These high boiling polar solvents also allow telescoping the following cyclization step which greatly simplifies the process.

d) Triazopyrimidine derivatives VI can be prepared by intramolecular cyclization of triazole derivative V in the presence of a base such as KHCO₃, Na₂CO₃ and water either with or without a solvent such as methanol, ethanol, dioxane and toluene. Alternative preferred conditions involve the use of DMA or NMP as solvents, preferably DMA. The reaction can be performed in the presence of KHCO₃ at 130-170° C., preferably between 140 and 160° C. Compound VI may exist as a tautomer or a mixture of tautomers, for example:

25

e) Chlorides VII can be obtained by reaction of VI with a chlorination reagent such as POCl_3 , SOCl_2 or $(\text{COCl})_2$ in the presence of an appropriate base such as N,N-diethyl aniline, lutidine, or pyridine. Alternative preferred conditions involve the use of the Vilsmeier reagent as chlorinating agent. It can also be generated in situ by reacting oxalyl chloride with DMF. The chlorination can be performed for example in acetonitrile, DCM or AcOEt, preferably in DCM. These conditions allow for mild reaction temperature and for example, avoid the quench of excess POCl_3 upon work-up. The crude product can be introduced in the next step.

f) VII are conveniently reacted with various nucleophiles, particularly amines, in the presence of an appropriate base such as triethylamine, DIEA or DBU in a suitable solvent such as acetonitrile, methanol, toluene or DMF to yield triazolo-pyrimidine derivatives I. If the nucleophile is an alcohol, the reaction can be performed using a base such as sodium hydride in a solvent such as DMF preferentially at temperatures between 0°C . and 50°C . or by applying other conditions known to a person skilled in the art, to arrive at ethers I.

These derivatives can be the final compounds, however preferably when $\text{R}^1\text{-A}$ =substituted benzyl group such as p-methoxy benzyl, these groups can be cleaved with TFA, CAN, hydrogenation and the like to access derivatives I ($\text{R}^1\text{-A}=\text{H}$). $\text{R}^1\text{-A}$ =benzyl represents a suitable alternative protecting group. It avoids the use of PMB-Cl (for the preparation of the corresponding azide intermediate III) which is known to have some thermal stability issues (see for example *Organic Process Research & Development* 2005, 9, 1009-1012) and varying quality depending on the supplier. The benzyl group can be cleaved under standard hydrogenolysis conditions also for example in the presence of acids. When HCl is used, the derivatives I ($\text{R}^1\text{-A}=\text{H}$) can potentially be isolated as salts.

The triazole derivatives I ($\text{R}^1\text{-A}=\text{H}$) is conveniently reacted either with a halide (or sulfonate) in the presence of suitable base such as DIEA, DBU, K_2CO_3 , or Cs_2CO_3 in a solvent such as DMF, dioxane or toluene, or alternatively with an alcohol under Mitsunobu reaction conditions using suitable diazodicarboxylate (DEAD, DIAD and the like) and phosphine such as PBU_3 or PPh_3 in an appropriate solvent such as THF, DCM, toluene to afford final triazolo-pyrimidine derivatives I.

The invention also relates to a process for the preparation of a compound of formula (I) comprising one of the following reaction:

(a) the reaction of a compound of formula (A), a tautomer thereof or a mixture of tautomers thereof, in particular as defined above

in the presence of a halogenation reagent and optionally with a base; or

26

(b) the reaction of a compound of formula (B)

(B)

in the presence of NHR^3R^4 and optionally with a base; wherein A, R^1 , R^3 and R^4 are as defined above.

In step (a), the base is for example N,N-diethyl aniline, lutidine or pyridine. Halogenation reagents are well known to those skilled in the art. Particular halogenation reagents are chlorination reagents. Examples of halogenation reagent are POCl_3 , SOCl_2 , $(\text{COCl})_2$ or Vilsmeier reagent. POCl_3 and the Vilsmeier reagent are particular halogenation reagents useful in the process of the invention.

In step (b), the base is for example triethylamine, DIEA or DBU.

In step (b), a solvent can be used, which can be selected for example from acetonitrile, methanol, toluene and DMF.

A compound of formula (I) when manufactured according to a process of the invention is also an object of the invention.

Alternative Conditions

Step 1: 5-amino-1-[(2-chlorophenyl)methyl]triazole-4-carboxamide

Sodium azide (3.36 g, 51.1 mmol, Eq: 1.05) was charged in the reactor followed by DMSO (35.2 g, 32.0 ml) and Hunig's base (642 mg, 868 µl, 4.87 mmol, Eq: 0.1). The suspension was stirred for 10 Min. at 25° C. Then 1-chloro-2-(chloromethyl)benzene (8 g, 6.29 ml, 48.7 mmol, Eq: 1.00) was added dropwise over 60 min. (Tr=25° C.) and stirred at 25° C. until reaction completion (<2 h). The resulting white suspension was treated with water (1.6 g, 1.6 ml) and stirred for 45 Min. at R.T. The suspension was filtered and the filter cake was washed with DMSO (17.6 g, 16.0 ml) to give a colorless solution of 1-(azidomethyl)-2-chloro-benzene solution.

In a separate reactor, DMSO (17.6 g, 16.0 ml) was charged followed by 32% aqueous NaOH (6.09 g, 4.51 ml, 48.7 mmol, Eq: 1.0) and water (5.00 g, 5.00 ml). A solution consisting of 2-cyanoacetamide (6.2 g, 73.0 mmol, Eq: 1.50) and DMSO (17.6 g, 16.0 ml) was added dropwise over 15 min. at 25° C.

44

The previously prepared azide solution was added dropwise at 25° C. within 4 h. After an additional 15 h reaction, water (120 g, 120 ml) was added dropwise over 10 min (exothermic). The resulting suspension was cooled to 0° C. After 1 h30 at 0° C. the suspension was filtered. The filter cake was washed with water (40.0 g, 40.0 ml) and dried under reduced pressure 50° C./5 mbar until constant weight to give 10.87 g of the title compound as a white powder. MS(m/e): 251.9 (MH⁺).

Step 2: 5-tert-butyl-3-[(2-chlorophenyl)methyl]-4H-triazolo[4,5-d]pyrimidin-7-one

5-amino-1-(2-chlorobenzyl)-1H-1,2,3-triazole-4-carboxamide (10.80 g, 42.9 mmol, Eq: 1.00) was suspended in N,N-dimethylacetamide (50.2 g, 54.0 ml). Pyridine (5.1 g, 5.19 ml, 64.4 mmol, Eq: 1.5) was added followed by pivaloyl chloride (7.84 g, 8.00 ml, 64.4 mmol, Eq: 1.5) and the reaction mixture was heated to ca 80° C. After 3 h reaction (and complete conversion of the starting material to the intermediate), KHCO₃ (21.6 g, 215 mmol, Eq: 5.00) was added and the suspension was heated to T_j=155° C. for 24 h to convert the 1-[(2-chlorophenyl)methyl]-5-(2,2-dimethylpropanoylamino)triazole-4-carboxamide intermediate to the product. The reaction mixture was cooled to RT and water (254 g, 254 ml) was added dropwise over 30 min. The brown suspension was cooled to 0° C., stirred for 1 h30 min and was filtered. The filter cake was washed with water (43.2 g, 43.2 ml) and dried

45

at 500° C./5 mbar to give 11 g of the title compound as an off-white powder. MS(m/e): 318.0 (MH⁺).

Step 3: 5-tert-butyl-7-chloro-3-[(2-chlorophenyl)methyl]triazolo[4,5-d]pyrimidine

DMF (10.1 g, 10.7 ml, 139 mmol, Eq: 4.14) and dichloromethane (113 g, 85.6 ml) were charged in the reactor and the solution was heated to 35° C. Oxalylchloride (8.66 g, 5.86 ml, 66.9 mmol, Eq: 2) was added over 1 h at 35° C. After 45 min at 35° C., a light turbid solution of 5-tert-butyl-3-(2-chlorobenzyl)-3H-[1,2,3]triazolo[4,5-d]pyrimidin-7(4H)-one (10.7 g, 33.4 mmol, Eq: 1.00) in Dichloromethane (32 ml) and DMF (2 ml) was added over 15 min at 35° C.

After 4 h at 35° C., the reaction mixture was cooled to RT and was slowly added onto cold (0-5° C.) half saturated aqueous NaHCO₃ (160 ml). The organic phase was separated and washed with water (119 g, 119 ml) and half saturated aqueous NaCl (119 ml). The organic phase was dried over MgSO₄, rotavaped and dried at 50° C./10 mbar to give 10.89 g of the title compound as an oil which solidifies on standing to provide a light yellow solid. MS(m/e): 335.9 (MH⁺).

Step 4 (3S)-1-[5-tert-butyl-3-[(2-chlorophenyl)methyl]triazolo[4,5-d]pyrimidin-7-yl]pyrrolidin-3-ol

5-tert-butyl-7-chloro-3-(2-chlorobenzyl)-3H-[1,2,3]triazolo[4,5-d]pyrimidine (10 g, 29.7 mmol, Eq: 1.00) was dissolved in Acetonitrile (54.6 g, 70.0 ml). N-Ethyl-diisopropylamine (7.84 g, 10.3 ml, 59.5 mmol, Eq: 2) was added dropwise over 5-10 min. After 10 min at RT, a solution of (S)-pyrrolidin-3-ol (2.94 g, 2.8 ml, 32.7 mmol, Eq: 1.1) in Acetonitrile (2.27 g, 2.91 ml) added dropwise over 30 min at 20° C. After 2 h 30 reaction, toluene (86.5 g, 100 ml) was added and the reaction mixture was concentrated under reduced pressure to remove most of the acetonitrile. A 10% aqueous citric acid solution (100 ml) was added. The aqueous phase was separated and extracted with toluene (86.5 g, 100 ml). The organic phases were washed sequentially with half saturated aqueous NaHCO₃ (50 ml) and half saturated aqueous NaCl (50 ml). The organic phases were combined dried over MgSO₄ and rotavaped at 45° C./10 mbar. The crude product was taken up in ethanol (150 ml) and concentrated under reduced pressure. This was repeated twice in order to remove toluene and gave 11.1 g of the crude title compound as a light yellow solid/foam.

The product can be crystallized, for example, from toluene/heptane or acetone/water. Crystallization from Toluene/n-Heptane

1.0 g of the crude product was dissolved at room temperature in 4 ml of Toluene. Then 8 ml of n-Heptane was added in one portion. The clear, light yellow solution was seeded (the seed crystals were obtained from a test tube crystallization in

46

Toluene/n-heptane). The crystallization started slowly. After 1 h at R.T., the white suspension was filtered. The filter cake was washed with n-Heptane and dried under reduced pressure (5-10 mbar) at 50° C. overnight then at 80° C. for 8 h to give 0.9 g of the title compound.

Crystallization from Acetone/Water

5.5 g of the crude product was dissolved at room temperature in 30 ml of Acetone. Then 13.6 ml of water was added in one portion. The clear, light yellow solution was seeded (the seed crystals were obtained from a test tube crystallization in acetone/water). The crystallization started slowly. After stirring overnight at RT, the white suspension was cooled down to 0° C., stirred for 2 h at 0° C. and filtered. The filter cake was washed with cold acetone/water 1:1 and dried at 80° C. under reduced pressure to give 4.9 g of the title compound.

Step 1 batch process:
5-amino-1-benzyl-triazole-4-carboxamide

147

Sodium azide (4.34 g, 66.0 mmol, Eq: 1.05) was charged in the reactor followed by DMSO (44.0 g, 40 ml) and Hunig's base (829 mg, 1.12 ml, 6.29 mmol, Eq: 0.1). The suspension was stirred for 10 min. at 25° C. (Chloromethyl)benzene (8 g, 7.29 ml, 62.9 mmol, Eq: 1.00) was added dropwise over 60 min at 25° C. After 3 h at 25° C., water (1.6 g, 1.6 ml) was added, the reaction mixture was stirred for 30 min and was filtered. The residue was washed with DMSO (17.6 g, 16.0 ml). The obtained benzyl azide solution was used directly in the cycloaddition step.

In a separate reactor, DMSO (17.6 g, 16.0 ml) was charged followed by, 32% aqueous NaOH (7.86 g, 5.82 ml, 62.9 mmol, Eq: 1.0) and water (5.00 g, 5.00 ml). A solution of 2-cyanoacetamide (7.93 g, 94.3 mmol, Eq: 1.50) in DMSO (17.6 g, 16.0 ml) was added dropwise over 15 min at 25° C. The previously prepared benzyl azide solution was added dropwise over 4 h at 25° C. The reaction was stirred overnight at 25° C. and water (120 g, 120 ml) was added dropwise over 30 min at 25° C. (exothermic). The resulting suspension was cooled over 30 min to 0° C., stirred at 0° C. for 30 min and filtered. The filter cake was washed with water (40.0 g, 40.0 ml) and was dried at 50° C./5 mbar to give 12.6 g of the title compound.

Step 2 continuous process:
5-amino-1-benzyl-triazole-4-carboxamide

Solution A: Benzyl Azide Solution Preparation:

Sodium azide (54.5 g, 829 mmol, Eq: 1.05) was charged in the reactor followed by DMSO (550 g, 500 ml). Water (37.5 ml) was added and the suspension was stirred at 40° C. for 3-4 h. Hunig's base (10.4 g, 14.1 ml, 79.0 mmol, Eq: 0.1) was added and the suspension was cooled to Tj=30-35° C. Benzyl chloride (100 g, 91.1 ml, 790 mmol, Eq: 1.00) was added dropwise over ca 1 h. The reaction mixture was stirred overnight at 30-35° C. The reaction was cooled to RT and filtered. The filter cake was washed twice with 40 mL DMSO to give 783 g of a light yellow solution (13.4% m/m BnN3 solution, d=1.086, 721 mL solution, 0.146 g/mL BnN3 solution)

Solution B: 2-cyanoacetamide Solution (Prepared in Excess):

120 g cyanoacetamide were dissolved in 327 mL DMSO d: 1.12
428 mL solution
0.28 g/mL

Solution C: 32% Aqueous NaOH
Reactor Design:

The two first reactors are microreactor of type XXL from LTF GmbH and are connected in series. The first reactor is used to perform the mixing of the different reagents (the reagent streams are preheated in a ca 1 mL preheater and then combined into a reactor volume of ca 2 mL), the second reactor is used as an additional residence time reactor (ca 5.5 mL volume). The microreactor output stream is then

148

connected to a CSTR cascade to provide additional residence time (a 20 mL then a 40 mL overflow reactor). The microreactors and CSTR overflow reactors are heated at 60-65° C.

Ca 85% conversion is achieved at the exit of the glass microreactor, ca 95% conversion within the first CSTR and >99% conversion at the exit of the second CSTR. Higher conversion can be achieved at the exit of the microreactors by increasing the residence time but to the cost of the throughput.

It is preferable to premix the cyanoacetamide and the base prior to contacting with the BnN3 stream. Indeed the azide can decompose in a runaway manner when contacted with NaOH. The stability also depends on the substitution (the stability decrease dramatically going from p-methoxybenzyl azide to BnN3 to 1-(azidomethyl)-2-chloro-benzene).

NaOH is also preferably used in stoichiometric or slightly sub-stoichiometric amounts. This represents a lab scale solution and other setups are of course possible, using other type of mixers/reactors for example standard static mixers (e.g. Kenics), CSTR cascades, coils, other type of glass or ceramic reactors and combination thereof which can be adapted depending on the desired throughput and scale.

Flows:

A: 3.6 mL/min; B: 1.88 mL/min; C: 0.54 mL/min, which corresponds to a 1:1.5:1.4 equivalent ratio.

Run Summary:

After a standard start-up procedure, the process was run for 3 h07 corresponding to 735 g BnN3 solution (based on flow and gravimetric monitoring). The output stream was discharged in a new collection tank ca every hour. The pumps were switched to a wash solvent and the microreactor exit was switched to waste. Meanwhile, the reaction was continued for ca. 10 min in the overflow reactors which were then emptied in the collection tank. The 3 collected fractions were transferred into a 3 L jacketed reactor and 1.5 L water was added over 5-10 min. The temperature rose from 25 to 43° C. The resulting suspension was stirred overnight at 25° C. then cooled for 2.5 h at 0-5° C. and filtered. The filter cake was washed three times with 100 ml water and dried at 50° C./5-10 mbar to give 154 g of the title compound as a white powder.

Step 2: 3-benzyl-5-tert-butyl-4H-triazolo[4,5-d]pyrimidin-7-one

149

-continued

5-amino-1-benzyl-1H-1,2,3-triazole-4-carboxamide (150 g, 691 mmol, Eq: 1.00) was suspended in N,N-dimethylacetamide (512 g, 550 ml). Pyridine (82.1 g, 83.5 ml, 1.04 mol, Eq: 1.5) was added followed by pivaloyl chloride (126 g, 129 ml, 1.04 mol, Eq: 1.5) and the reaction mixture was heated to Tj=80° C. After complete acylation (ca 1 h30), KHCO₃ (347 g, 3.45 mol, Eq: 5.00) was added and the suspension was heated to Tj=155° C. to convert the 1-benzyl-5-(2,2-dimethylpropanoylamino)triazole-4-carboxamide intermediate to the product. After 18 h30 at 155° C., the reaction mixture was cooled to RT and water (3.48 kg, 3.48 l) was added dropwise within 30 Min. The light yellow suspension was stirred for 30 min at RT, 2 h at 0° C. and filtered. The filter cake was washed with cold (0-5° C.) water (600 g, 600 ml) and dried at 50° C./5 mbar to give 161.3 g of the title compound as an off-white powder. MS(m/e): 284.0 (MH⁺).

DMF over MS(105 g, 110 ml, 1.43 mol, Eq: 2.56) was charged in the reactor followed by Dichloromethane (1.46 kg, 1.1 l). The solution was heated to 35° C. and oxalylchloride (144 g, 97.6 ml, 1.11 mol, Eq: 2) was added over 1 h. After 45 min, a fine suspension of 3-benzyl-5-tert-butyl-3H-[1,2,3]triazolo[4,5-d]pyrimidin-7(4H)-one (161 g, 557 mmol, Eq: 1.00) in a mixture of dichloromethane (877 g, 662 ml) and DMF (41.8 g, 44.1 ml) was added over of 20 min. After 3 h, the reaction mixture was cooled to RT and slowly added to a cold (0-5° C.) half saturated aqueous NaHCO₃ (1.76 l). The organic phase was separated and washed again with half saturated NaHCO₃ (662 ml) followed by water (662 g, 662 ml). Then the org. phase was dried over MgSO₄ and was concentrated under reduced pressure at 50° C./down to 10 mbar to give 192 g of a crude oil which does crystallize on standing. The crude 3-benzyl-5-tert-butyl-7-chloro-triazolo[4,5-d]pyrimidine was introduced in the next step without further purification.

Step 4: (3S)-1-(3-benzyl-5-tert-butyl-triazolo[4,5-d]pyrimidin-7-yl)pyrrolidin-3-ol

3-benzyl-5-tert-butyl-7-chloro-3H-[1,2,3]triazolo[4,5-d]pyrimidine (192.2 g, 548 mmol, Eq: 1.00) was charged in the

reactor followed by Acetonitrile (780 g, 1.0 l) and N-Ethyl-diisopropylamine (108 g, 143 ml, 822 mmol, Eq: 1.5). (S)-Pyrrolidin-3-ol (54.1 g, 51.6 ml, 603 mmol, Eq: 1.1) was added dropwise over 30 min at Tr=20 to <30° C. After 2 h at 25° C., the reaction mixture was transferred with Toluene (865 g, 1.0 l) into a 3 l round bottom flask and it was concentrated on a rotary evaporator, to switch solvent to toluene. The toluene solution was washed with a 10% aqueous citric acid solution (1.0 l). The aqueous phase was separated and extracted with toluene (434 g, 500 ml). The org. phases were washed sequentially with half saturated aqueous NaHCO₃ (500 ml) and half saturated aqueous NaCl (500 ml). The org. phases were combined, dried over MgSO₄ and concentrated at 45° C. to ca 500 mL. Heptane (684 g, 1.0 l) was added under stirring. After 5-10 min the product started to crystallize. The white suspension was stirred for 2 h at RT and was filtered. The white filter cake was washed with heptane (274 g, 400 ml) and dried at 45° C./5 mbar to give 186.9 g of the title compound as a white powder. MS(m/e): 353.1 (MH⁺).

Pharmacological Tests

The following tests were carried out in order to determine the activity of the compounds of formula I:

Radioligand Binding Assay

The affinity of the compounds of the invention for cannabinoid CB1 receptors was determined using recommended amounts of membrane preparations (PerkinElmer) of human embryonic kidney (HEK) cells expressing the human CNR1 or CNR2 receptors in conjunction with 1.5 or 2.6 nM [3H]-CP-55,940 (Perkin Elmer) as radioligand, respectively. Binding was performed in binding buffer (50 mM Tris, 5 mM MgCl₂, 2.5 mM EDTA, and 0.5% (wt/vol) fatty acid free BSA, pH 7.4 for CB1 receptor and 50 mM Tris, 5 mM MgCl₂, 2.5 mM EGTA, and 0.1% (wt/vol) fatty acid free BSA, pH 7.4 for CB2 receptor) in a total volume of 0.2 ml for 1 h at 30° C. shaking. The reaction was terminated by rapid filtration through microfiltration plates coated with 0.5% polyethylenimine (UniFilter GF/B filter plate; Packard). Bound radioactivity was analyzed for K_i using nonlinear regression analysis (Activity Base, ID Business Solution, Limited), with the K_d values for [3H]CP55,940 determined from saturation experiments. The compounds of formula (I) show an excellent affinity for the CB2 receptor with affinities below 10 μM, more particularly of 1 nM to 3 μM and most particularly of 1 nM to 100 nM.

The compounds according to formula (I) have an activity in the above assay (K_i) particularly of 0.5 nM to 10 μM, more particularly of 0.5 nM to 3 μM and most particularly of 0.5 nM to 100 nM.

cAMP Assay

CHO cells expressing human CB1 or CB2 receptors are seeded 17-24 hours prior to the experiment 50.000 cells per well in a black 96 well plate with flat clear bottom (Corning Costar #3904) in DMEM (Invitrogen No. 31331), 1×HT supplement, with 10% fetal calf serum and incubated at 5% CO₂ and 37° C. in a humidified incubator. The growth medium was exchanged with Krebs Ringer Bicarbonate buffer with 1 mM IBMX and incubated at 30° C. for 30 min. Compounds were added to a final assay volume of 100 l and incubated for 30 min at 30° C. Using the cAMP-Nano-TRF detection kit the assay (Roche Diagnostics) was stopped by the addition of 50 μl lysis reagent (Tris, NaCl, 1.5% Triton X100, 2.5% NP40, 10% NaN₃) and 50 μl detection solutions (20 μM mAb Alexa700-cAMP 1:1, and 48 μM Ruthenium-2-AHA-cAMP) and shaken for 2 h at room temperature. The time-resolved energy transfer is measured by a TRF reader (Evotec Technologies GmbH), equipped with a ND:YAG laser as excitation source. The plate is measured twice with the excitation at 355 nm and at the emission with a delay of 100 ns and a gate of 100 ns, total exposure time 10 s at 730 (bandwidth 30 nm) or 645 nm (bandwidth 75 nm), respectively. The FRET signal is calculated as follows: FRET=T730-Alexa730-P(T645-B645) with P=Ru730-B730/Ru645-B645, where T730 is the test well measured at 730 nm, T645 is the test well measured at 645 nm, B730 and B645 are the buffer controls at 730 nm and 645 nm, respec-

tively. cAMP content is determined from the function of a standard curve spanning from 10 μM to 0.13 nM cAMP.

EC₅₀ values were determined using Activity Base analysis (ID Business Solution, Limited). The EC₅₀ values for a wide range of cannabinoid agonists generated from this assay were in agreement with the values published in the scientific literature.

All compounds are CB2 agonists with EC₅₀ below 3 μM and selectivity versus CB1 in the corresponding assay of at least 10 fold

For example, the following compounds showed the following human EC₅₀ values in the functional cAMP assay described above:

β-Arrestin Translocation Assay-PathHunter™ (DiscoverX)

PathHunter™ β-arrestin CHO-K1 CNR1 cell line (catalog number #93-0200C2) and the β-arrestin CHO-K1 CNR2 cell line (catalog number #93-0706C2) were purchased from DiscoverX Corporation. The cell line was engineered to express the β-galactosidase EA fragment fused to β-arrestin and the ProLink complementary peptide fused to the target receptor. The PathHunter™ protein complementation assay (DiscoverX Corporation #93-0001) was performed according to the manufacturer's protocol. Assay plates were seeded containing 7500 (CNR1) and 10000 (CNR2) cells in 384 well plates (Corning Costar #3707, white, clear bottom) in 20 μL cell plating reagent 2 (DiscoverX #93-0563R2A). After incubation at 37° C. (5% CO₂, 95% relative humidity) overnight, 5 μL of test compound was added (1% final DMSO concentration) and the incubation continued at 30° C. for 90 min. Detection reagent (12 μL) was then added and the incubation continued at room temperature for 60 min. Plates were then analyzed for a chemiluminescent signal using a Victor ³V reader (Perkin Elmer).
